

PRODUCT DATASHEET

Roadway Gate

The FloodBreak Roadway Gate is a fully-engineered flood mitigation system designed for continuous traffic service in open roadways. The system is specially coated for extreme wear conditions and is designed to heavy safety standards and for long service life.

Levee Crossings * Bridges * Subdivisions * Campuses

Revolutionary Flood Control

Like the rest of FloodBreak's passive flood mitigation products, the Roadway Gate is fully automatic and does not depend on people or power to deploy. It is the only practical, truly passive flood control solution, the preferred method according to FEMA.

A Practical Solution for Levee Recertification

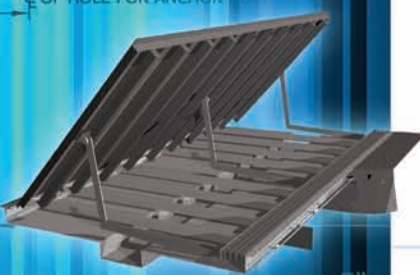

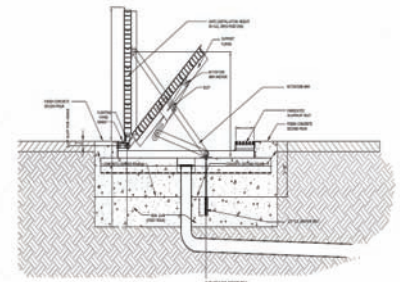

The FloodBreak Roadway Gate is a cost effective solution for communities seeking to extend, raise, or re-certify their community's levee systems. Significantly less costly than raising miles of roadway, it is also easy to install helping accelerate project completion.

How It Works

The system uses hydrostatic pressure created by the rising flood waters to automatically activate the gate. When the flood recedes, the gate automatically returns to its hidden position beneath the road allowing vehicle traffic to resume.

Features:

- Passive flood mitigation preferred by FEMA
- Manufactured to exact size requirements
- Weather resistant materials & durable rubber gaskets
- Meets vehicle load specifications
- Minimal maintenance
- No training required
- Easy to install
